

Silver & Stones Sprint 2 Usage

Team Ramrod

Source code: <http://github.com/alephtwo/cs485>

Live website: <http://silverandstones.gallery>

This sprint dealt with the ability to manage inventory, including items and categories. In order to test this functionality, you should first log in using the following details:

Email: admin@silverandstones.gallery

Password: administrator

The top bar of the application is home to the inventory management tools. You should be able to click “Items” and see all the items in the system, as with the categories. Drop down menus allow you to add new categories or items. In order to see a list of all items in the system by category, you can click the “Inventory” link. Clicking an item should allow you to see the item’s show page; you should similarly be able to edit items. Items must first be deactivated before they can be deleted, to prevent accidental deletion.

Another job we did this sprint was to manage user creation; you are able to sign up for the website at will, provided you use a valid email address. (This does not work on production codebase yet due to an SSL certificate) Users that are logged in are able to edit their profiles. Each user has a role from 0-4, as assigned by an administrator; the default is 0, matching no privileges. 1-4 match view, edit, add, and delete privileges for finer granularity in terms of how staff members are able to modify the data present. The “Users” link in the top bar allows an administrator to modify user roles for each user, as well as see every user in the system.

This sprint also set up work for Sprint 3 by creating email templates. Users that sign up are sent an email that is customizable by the staff. We also want to allow for the sending of coupons through the mail. The limited functionality allows one to edit the templates that are currently in the system.
